

EIA Secure

Networked Security Technologies

EIA's innovative security solutions include design, installation and maintenance services that provide access control and video surveillance. These solutions fall under a "Networked Umbrella" forming a single integrated system – EIA Secure.

To achieve maximum security, businesses and agencies can take advantage of EIA's unique combination of technologies. These technologies include laser, radar, fiber, wireless, surveillance cameras, door access, biometrics, etc.

EIA's technologies are networked and belong in a "Leading Edge" technology classification, never "Bleeding Edge." We note this important distinction to assure our customers that all offered solutions have been previously and successfully installed by EIA Technologists and Engineers. No experimentation here.

EIA couples the best of technology with our deep engineering expertise in network security, from audits to implementation. We offer proactive security that never stops. If you need security integration, let EIA deliver it for you.
